Oligonucleotide array, useful for measuring ortholog gene-expression distribution, comprising number of oligonucleotides derived from ortholog gene of different organism immobilized on support.

Disclosure; Page 16; 56pp; Japanese.

The invention relates to a novel oligonucleotide array comprising a number of oligonucleotides derived from an orthologue gene of a different organism or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different organisms, in which one side comprises a human gene. In the oligonucleotide array a base sequence differs in a different position on the support body. Each of the oligonucleotides is a partial sequence of the orthologue gene of the organism A and organism B. The sequence match degree of the organism species A and the organism species B is less than 70%. The sequence homology of the genes other than the orthologue gene of

```
temperature of the variant genes other than the orthologue gene of temperature of the variant genes other than the orthologue gene of the organism species B is 20 degrees C or more. The oligonucleotide array is useful for measuring expression distribution of the orthologue gene in different organisms. The method is useful for comparing expression change of the orthologue gene with respect to medical-agent administration and for comparing change of the function of the orthologue gene in different organisms. The oligonucleotide array has the ability to perform a measurement of gene-expression distribution of two or more types of organism simultaneously. The oligonucleotide array improves reliability of measurement. This polynucleotide sequence represents a probe of a rat gene for comparison against a human gene used
the organism species A and the organism species B is the level-of-statistical-significance value, calculated using the homology searching algorithm: basic local alignment search tool (BLAST) and the value is 0.1 or more. The found value or the calculated value of the melting-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in the oligonucleotide array of the invention.

specific genes.

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several

```
continuetorizes, each eagain of appearance of the genome, which encodes one or more messenger RNA splice variants. The which encodes one or more messenger RNA splice variants. The coligonoucleotide libraries are useful for detecting RNAs from a biological sample, in expression profilling studies, in qualitatively or biological sample, in expression profilling studies, in qualitatively or detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minical transcriptomes. The libraries may also be used as specialised minical interpretation of taste, and so allowing the detection of tissue coliogical or pathological state, and so allowing the detection of tissue coliogical or pathological state, and so allowing the detection of tissue coliogical or pathological state, and so allowing the detection of tissue specific genes such as those genes only expressed in specific genes; and to detect RNA transcriptom to detect colionate and splice containts of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from a particular containt invention. N.B. The sequence data for this patent did not form to part of the printed specification, but was obtained in electronic format containt of the printed specification, but was obtained in electronic format containts of the printed specification int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2290
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

inhibition of expression of a target gene, where (I) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang having a length of 0-inucleotide to 5-incleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (I); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed different double-stranded RNAs; (3) an array-based method of assessing a phenotypic effect of a double-stranded RNA on a target gene; (4) validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene comprising any of 311 20-78 cullibiting expression of a target gene comprising any of 311 20-78 cullibiting expression of a target gene comprising any of the sequence genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g. cancer

New RNA comprising double stranded RNA and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression

Finney HM, Lawson ADG;

```
The present invention describes an RNA (I) used for the interference or inhibition of expression of a target gene, where (I) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang a length of 0-nucleotides in length and a 3' or 5' overhang contains a length of 0-nucleotide to 5-nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell or expression of a target gene in a cell or expression of a target gene in a cell or expression of a target gene in a cell or expression and sed responding array comprising a substantially flat substrante, and addressably arrayed different double-stranded RNAs; (3) an array-based method of assessing a comprising a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and condition of a target gene condition; and condition of a target gene condition are condition; and condition of a target gene condition; and condi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1187 AGCGCCAGGAGCAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAGC 1246

61

of membrane-associated

```
The present sequence was used in the construction of chimeric receptors.

The properties and level of expression of a membrane-associated protein
may be altered by substituting a transmembrane region or a membrane-
anchoring region for transmembrane or membrane-anchoring regions that are
not naturally part of the protein. The relative response of membrane-
associated proteins to cell surface-associated antigen versus antigen in
solution, and the sensitivity of intracellular signaling mediated by
membrane-associated proteins can be altered. They can be important in
treatment of, e.g. HIV infection, bacterial infections, parasitic
infections, inflammatory/autoimmune disorders (e.g. relemantoid arthritis,
osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic
diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic
fibrosis or sickle cell anaemia), dermatological disorders (e.g.
psoriasis), neurological disorders (e.g. multiple sclerosis), organ
transplant rejection, graft-versus-host diseases, or metabolic/idiopathic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chechechechechechedagenechechechechechechechechechechecheche

                                                                                                                                                                                    anchoring region for transmembrane or membrane-anchoring regions that are anchoring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane-associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic fibrosis), neurological disorders (e.g. multiple sclerosis), organ transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence was used in the construction of chimeric receptors. The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane-
          Altering the properties or level of expression of membrane-associated proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; trinucleotide repeat instability; TNR; cancer; ds; fragile X syndrome; Huntington's disease; myoconic dystrophy; spinal and bulbar muscular atrophy; SBMA; SCA I; Kennedy's disease; spinocerebellar ataxia type I; Friedreich's ataxia; DRPLA; Gentatorubaral-palidoluyalan atrophy; SCA8; SCA12; SCA2; SCA6; SCA7; SCA3; Machado-Joseph disease; testicular cancer; prostate cancer.

Detecting alterations in trinucleotide repeat (TNR) tract lengths in

Miret JJ;

Lahue RS, Pelletier R, (UYNE-) UNIV NEBRASKA

WPI; 2002-575460/61

```
The invention relates to detecting (M1) alterations in trinucleotide repeat (TNR) tract lengths comprising: (i) contacting mammalian cells with a shuttle vector (containing approximately 25 repeats) that enters and replicates in the cells; (ii) introducing the vector into a yeast cell in the presence of a selection agent or (where the expanded TNR confers a His+ phenotype) in the absence of histidine, alteration to the TNR tract confers resistance to the selective agent or His+ phenotype; and (iv) selecting yeast cells with the shuttle vector containing TNR tract confers that survived the presence of the selective agent. Also included is an adaptation of the used to detect the contraction of 33 or 55 repeats using growth of the yeast cells in the absence of uracil. The methods of the present invention are useful for identifying disorders methods of the present invention are useful for identifying disorders (e.g. testicular and prostate), Fragile X Syndrome, Huntington's disease, myterious disease, myterious disease, myterious displaced and prostate, Pragile X Syndrome, Huntington's disease, myterious displaced and prostate), Fragile X Syndrome, Huntington's disease, myterious displaced and prostate of the macular atrophy (SMM),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1192 CAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAGCGGGAG 1251

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                 The present sequence was used in the construction of chimeric receptors. The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane-anchoring region for transmembrane or membrane-anchoring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane-associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, in the contraction of the contraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. psoriasis), neurological disorders (e.g. multiple sclerosis), organ transplant rèjection, graft-versus-host diseases, or metabolic/idiopathic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27
                                                                                                                   Altering the properties or level of expression of membrane-associated proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       86 agaacaggagcagcagcagcagcagagcaggagcagcaggagcaggagcaggagcaggagca

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonucleotide primer (I) at low stringency, preparing single-stranded coDNA by reverse transcribing mRNA with (I), amplifying single-stranded cDNA by reverse transcribing mRNA with (I), amplifying con amplifying steps with different primers and sequencing, preparing and properties and sequencing that a known manipulating sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism corresponds to a nucleic acid molecule from a genome of an organism; and for sequencing all or part of agenome of an organism. mRNA is obtained from mammalian cor human cell which is associated with a pathological condition e.g. a colon cancer or breast cancer cell. The method is useful for analyses of large or small populations of subjects and can be used to carry out genetic analyses of populations of subjects and can be used to study living systems to determine if, e.g. there have been genetic shifts which render an individual or population more or less likely to be afflicted with diseases such as cancer, to determine antibiotic resistance or non-tolerance, and so forth. The method can also be used to offspring through ova or sperm. The analyses for pathological conditions can be crucial diseases, and the risk of affliction to a foetus, as well as through ova or sperm. The analyses for pathological conditions can be crucial out in all animals, plants, birds, fish, etc. Using this method, in the area of agriculture, for example the genomes of corps corps.

C carried out in all animals, plants, birds, fish, etc. Using this method, in the area of agriculture, for example the genomes of food crops can be crucially to be passed to the genome can also be studied in this way. Similarly, the method erope crops retroviruses and other integrating viruses such as influenced as p 1196 AGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAAGCAGCTGGAGAAGCAGCAGCGGGAGAGCTGG 1255 trypanosomes, different types of Plasmodium, etc. The method essentially eliminates sequencing of non-coding portions. This sequence represents a polynucleotide isolated from human colon cancer cell cDNA library Determining open reading frames of genome of an organism e.g. a human suffering from cancer involves use of single oligonucleotide primer at low stringency for preparing single-stranded cDNA from mRNA of 0; Gaps nucleic acid analysis; variation assessment; neurological disease; Huntington's chorea; PCR suppression; ss. 1.1%; Score 39.2; DB 10; Length 97; 33.4%; Pred.                                                                                                                                                                                                                                                                                                                                                             This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II, by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CAG repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SCA2 gene; spinocerebellar ataxis type II; CAG repeat; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 78 BP; 23 A; 30 C; 25 G; 0 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1183 CGGGAGCGCCAGGAGCAGGAGGCCAAGCGGCAGCTGGAGAAGCAGCTGGAGAAG 1242
                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a fragment of a human CAG repeat containing clone DNA sequence isolated using the method of the invention. The method is for analysing nucleic acids in a sample, and comprises: (a) providing a sample containing nucleic acid, a first oligonucleotide primer comprising a CTG repeat, a second oligonucleotide primer comprising a CAG repeat and a polymerase and PCR reagents; (b) preparing the nucleic acid so that it is amplifiable; (c) amplifying the nucleic acid with the first and second primers; and (d) detecting the amplified product. The method is used to distinguish between the expression of genes in two or more blological samples, e.g. body fluids, cells, solid tissue or solid and liquid foods. It can be used in medical diagnostics, e.g. to differentiate between normal and diseased tissue or to assess the variation within monozygotic twin pairs. The method allows the isolation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and analysis of genome subsets containing CAG repeats which are known to be important in a number of neurological diseases including Huntington's chorea. The method uses PCR suppression, in which only fragments which contain a target repeat are efficiently amplified. This allows accurate identification of differentially expressed genes in various cell types. Genome complexity is reduced by the new method which targets genomic subsets containing CAG repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysing nucleic acid samples - using amplification primers which contain CAG or CTG tri:nucleotide repeats for differential display of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

by PCR and determining number

```
The invention relates to a nucleic acid hybridisation probe comprising a labelled, single copy nucleic acids of at least 50 nuclectides, which will hybridise to a deduced single copy sequence interval in traget nucleic acid (TNA) of known sequence. The single copy sequence is deduced by comparing the target nucleic acid (e.g. a disease causing gene) with a collection of high and low complexity repeat sequences as found in the genome of the organism from containing the target nucleic acid. The probe is generated by PCR on the target sequence. The probe is essentially free of blocking nucleic acid sequences which will hybridise to repeat equences within the genome of which the TNA is a part, and is labelled with a label selected from fluorochrome-responsive labels, fluorochromes, calorimetric chemical, conjugated proteins, antibodies, antigens and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    histone cell cycle regulation defective, S. cerevisiae homologue A; HIRA; low complexity repeat; in situ hybridisation; Southern bloc; chromosome breakpoint; inherited genetic disease; neoplastic disorder; chromosome 22; DiGeorge syndrome; Velo-Cardio-facial syndrome.
This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II, by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CAG repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                                                                                                                                                                                                                                 9

their mixtures. The probe is useful in a hybridisation method, where the hybridisation method is from in situ hybridisation, Southern blot, and cother methods in which nucleic acid is immobilised, where the method further comprises selecting a single copy nucleic acid which will confirm the comprises selecting a single copy nucleic acid which will confirm the comprises selecting a single copy nucleic acid which will confirm the probe in useful confirmation or triplicon sequence domain. The probe is useful for the genome. The genome at more than three preferably ten different locations as a determination of new repeat sequence family, where the determining step comprises selecting the single copy sequence from a duplicon or triplicon sequence domain. The probe is useful for chermining a chromosome breakpoint and is useful in the fields for determining a chromosome breakpoint and is useful in the fields for cycogenetics and molecular genetics for determining the presence of specific nucleic acid sequences in a sample of eukaryotic origin, e.g. the probes may be used to analyse specific chromosomal locations by in situ hybridisation as a detertion of acquired or inherited genetic diseases especially for detection of acquired or inherited genetic diseases especially for detection of genetic or neoplastic disorders. Unlike prior art techniques, the probe permits more precise chromosomal breakpoint determinations by in situ hybridisation defective, comprising the human HIRA gene (histone call corp lead to bigocyce and to comprising the human HIRA gene (histone call corp lead to bigocyce and intervals for use as probes of the invention. HIRA is located on chromosome 22 as a duplicate, deletions of locyp lead to bigocyce and chromosome 22 as a duplicate, deletions of locyp lead to bigocyce and chromosome region found within the human genome used to analyse the HIRA gene for repeat found within the human genome was organized to analyse the HIRA gene for the prepeat found within the human encome used to analyse the HIRA

Altering the properties or level of expression of membrane-associated proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling.

Example 2; Fig 3; 47pp; English.

osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. psoriasis), neurological disorders (e.g. multiple sclerosis), organ transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes) The present sequence was used in the construction of chimeric receptors. The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane anchoring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane-associated proteins to cell surface-associated antigen versus antigen in membrane-associated proteins to a literacellular signaling mediated by membrane-associated proteins can be altered if they can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthitis,

```
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwM22 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XI10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Contact: Robert B.                                                                                                                                                                                                                                                                                                                                                                                                                                                         y
                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMDA2 (gil 4732114|gbl=A72972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 (bases 1 to 86)
Asamizu, E., Nakamura, Y., Sato, S. and Tabata, S.
A large scale analysis of cDNA in Arabidopsis thaliana: Generation
of 12,028 non-tandant expressed sequence tags from normalized and
size-selected cDNA libraries
DNA Res. 7 (3), 175-180 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The First Laboratory for Plant Gene Research

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi | 4732114 | gb | AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5

The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWN42 (gi[472114]), a copy-number inducible derivative of plasmid R1. The vector was ligated

```
with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 B., SLC, UT 84112, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                     1219 GAGCTGGAGAAGCAGCTGGAGAAGCAGCGGGAGCTGGAGCGGCAGCGAGGAGGAGGAGGGGG 1278

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi[4732114]gb[AR129072.1], a coop-number of pMD42 (gi[4732114]gb[AR129072.1]), a coop-number of inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and ppurified. The sheared, adaptored mouse DNA was annealed to adaptored wector DNA, and transformed into chemically-competent B. coli X110-GGld (Stratagene) cells and selected for ampicillin resistance."

was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|$plA129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/close libe 1006 - RescueMu Grid G" (note="Organ: leaf; Vector: RescueMu (engineered from fnote="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHi; Site_2: BglII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.rambb.iastace.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DHIOB cells were transformed and then screened on LB plates with

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating CDNA sequences cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                         Human, S' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.
diagnostic, forensic, gene therapy and chromosome mapping procedures.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBR3999), a sequence having 65% sequence identity to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSHL1 including disgnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a single exon probe useful in examples of the printine, but is brand or sequence did not form part of the printed the protein control or the present sequence did not form part of the printed the protein control or c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specification, but is based on sequence information supplied to Derwent

comprising several chimeric molecules, where each chimeric molecule has a self-coalescing element (SCE) which is fused, linked or associated with a molecule of interest, and where each SCE is capable of causing individual chimeric molecules to coalesce with other chimeric molecules into higher order aggregates under conditions favourable to aggregation. The aggregate is useful for treating or preventing a disease or condition in a patient and has a range of applications including therapeutic, prophylactic and chemical processes. The aggregate comprises a therapeutic polypeptide such as granulocyte-macrophage colony-stimulating factor (GM-CSF), useful for treating haematopoietic conditions such as myelosuppressive disorders e.g. AIDS, infectious diseases, autoimmune diseases, allergies, viral, bacterial and parasitic infections and cancers such as melanoma, leukaemia and lymphoma. This sequence represents DNA encoding an SCE peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  413 GluLysGlnArgGluLeuGluArgGlnArgGluGluGluArgArgLysGluIleGluArg 432

comprising a nucleic acid of the invention. The cotton ESTB are useful as molecular taggs to isolate genes, to amportant reage to isolate genes, to map genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes are associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to militate stresses encountered during seed germination. The ESTB additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecules are further useful for detecting the presence or quantity of a protein or mRNA and for detecting the presence or quantity of a protein or mRNA and for detecting the presence as epecifically claimed EST isolated from a cotton variety Nucotton338 gynoecium tissue cDNA library (LIB3829). The sequence data for this patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of the printing the printing patent did not form part of specification, but was obtained in electronic format directly from the US patent office at segdata.uspto.gov/sequence.html?DocID=US20040123340

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes.

Claim 1; SEQ ID NO 15848; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTS;
ACN45220-ACN63099). The ESTS were isolated from CDNA libraries generated
CC ACN45220-ACN63099). The ESTS were isolated from CDNA libraries generated
CC from prined or non-primed seeds from variety DPSOB, manuture seeds from
Variety COKer 312 Boswell 96 Field, and androecium tissue, gynoecium
CC variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
CC tissue, developing fibres, carpel walls and septa from variety
CC Nucottoni3B. The invention also relates to substantially purified
CC comprising an uncleic acid of the invention. The cotton ESTs are useful as
CC comprising a nucleic acid of the invention. The cotton ESTs are useful as
CC comprising a nucleic acid of the invention. The cotton ESTs are useful as
CC members of a particular gene family. The nucleic acid molecules may be
CC members of a particular gene family. The nucleic acid molecules may be
CC members of a particular gene family. The nucleic acid molecules are
CC used for isolating a variety of agronomically significant genes important in initiating and molecular
CC associated with plant growth, quality, yield, and could also serve as
CC inks in metabolic and catabolic pathways. The nucleic acid molecules are
CC during seed germination. The ESTS additionally enable the acquisition of
CC during seed germination. The ESTS additionally enable the acquisition of
CC during seed germination. The ESTS additionally enable the acquisition of
CC detecting the acquisition of molecular markers useful in breaching
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the expression a specifically of a protein by tissue printing.
CC sequence represents a specifically printing of a protein by tissue printing of a protein or present specification, but was obtained in electronic format directly from the patent office at seqdata.uspto.gov/sequence.html?DocID=US20040123340

                                                                                           \mathbf{n}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        407 GluLeuGluLysGlnLeuGluLysGlnArgGluLeuGluArgGlnArgGluGluGluArg 426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; cytokine; cell proliferation; cell differentiation; gene therapy;
cotton variety Nucotton33B gynoecium tissue cDNA library (LIB3829). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from the U patent office at segdata.uspto.gov/sequence.html?bocID=US20040123340
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vaccine; peptide therapy; stem cell growth factor; haematopolesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to 17880 cotton expressed sequence tags (ESTs; ACM45220-ANN63099). The ESTs were isolated from CDNA libraries generated from primed or non-primed seeds from variety DP508, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, develophing fibrare, carpel walls and septer from variety Nucotton318. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the
                                                                                                                                                                                                                                                                                                Cotton; plant; EST; expressed sequence tag; transgenic plant; gynoecium; variety Nucotton33B; library LIB3829; molecular tag; molecular marker; genetic mapping; molecular mapping; seed germination; plant growth; plant quality; plant yield; plant breeding; tissue printing; ss.
treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
